Ру	ython Module Index	31
In	dex	33

Example implementations of the practice and challenge projects in Impractical Python Projects. Alternative answers to practice projects and supporting files can be found at the official GitHub page.

It's a fantastic intermediate level book that has truly impractical (but fun) projects. It's a great way to get tricked into learning new conventions, techniques, and modules. My closed PRs and the comments on my release commits act as a blog of sorts detailing some of the things learned along the way.

My original python-tutorials repository is already very nested, so these will be easier to find and review here; however, the original repository still has relevant information about configuring a Python environment/IDE.

Bonus content includes Google style docstrings (such wow), main functions (so standard), pip requirements files (so helpful), and test files (**not** punny at all).

CHAPTER

ONE

SRC

1.1 src package

1.1.1 Subpackages

src.ch01 package

Subpackages

src.ch01.challenge package

Submodules

src.ch01.challenge.c1_foreign_bar_chart module

Return letter 'bar chart' of a non-English sentence.

```
src.ch01.challenge.c1\_foreign\_bar\_chart.add\_keys\_to\_dict (dictionary: dict) \rightarrow dict
Add keys to dictionary.
```

Check keys of a letter dictionary and add missing letters.

Parameters dictionary (dict) – Dictionary to check keys of.

Returns Dictionary with string.ascii_lowercase as keys.

Raises TypeError – If dictionary is not a dict.

```
src.ch01.challenge.cl_foreign_bar_chart.foreign_freq_analysis(sentence: str) <math>\rightarrow dict
```

Wrap freq_analysis and add_keys_to_dict.

Passes given sentence through freq_analysis() then add_keys_to_dict() to fill in missing keys.

Parameters sentence (str) – String to count letters of.

Returns Dictionary with string.ascii_lowercase as keys and a list with letters repeated based on their frequency as values.

```
src.ch01.challenge.cl_foreign_bar_chart.main()
    Demonstrates the Foreign Bar Chart.
```

src.ch01.challenge.c2_name_generator module

Generate pseudo-random names from a list of names.

```
src.ch01.challenge.c2_name_generator.add_name_to_key (name: str, dictionary: dict, key: str) \rightarrow None
```

Add name to key in dictionary.

Add name to dictionary under key if not already present.

Parameters

- name (str) Name to add to dictionary.
- **key** (str) Key to add **name** under.
- **dictionary** (*dict*) Dictionary to add **name** to.

Returns None. name is added under key if not present, dictionary is unchanged otherwise.

Raises TypeError - If name and key aren't str or if dictionary isn't a dict.

```
src.ch01.challenge.c2\_name\_generator.build\_name\_list (folderpath: str) <math>\rightarrow list Build name list from folder.
```

Builds list of names from name files in given folder.

Parameters folderpath (str) – Path to folder with name files.

Returns List with names from **folderpath**.

Raises IndexError – If folderpath has no .txt files.

```
src.ch01.challenge.c2\_name\_generator.generate\_name (name\_dict: dict) \rightarrow str
Generate pseudo-random name.
```

Use names in dictionary to generate a random name.

```
Parameters name_dict - Dictionary from split_names().
```

Returns String with a random name.

Raises KeyError – If there aren't three keys in the dictionary.

Note: Only add middle name between 1/3 and 1/4 of the time.

```
src.ch01.challenge.c2_name_generator.main()
    Demonstrate name generator.
```

```
src.ch01.challenge.c2\_name\_generator.name\_generator(folderpath: str) \rightarrow str Wrap generate_name, split_names, and build_name_list.
```

Passes given **folderpath** through <code>build_name_list()</code> to get the names in a <code>list</code>, then <code>split_names()</code> to split them into a <code>dict</code>, and finally through <code>generate_name()</code> to make the actual name.

Parameters folderpath (str) – Path to folder with name files.

Returns String with pseudo-random name.

```
src.ch01.challenge.c2_name\_generator.read\_from\_file(filepath: str) \rightarrow list Read from file.
```

Reads lines from text file and returns a list.

Parameters filepath (str) – Path to file with names.

Returns List with each line from the file as an element.

Note: Removes trailing whitespaces.

```
src.ch01.challenge.c2_name_generator.split_names (name\_list: list) \rightarrow dict Split names from list of names.
```

Splits first, middle, and last names from a given list of names.

Parameters name_list (list) - List with names as elements.

Returns Dictionary of lists with first, middle, and last as keys and names as values.

Raises

- TypeError If given name list is not a list or tuple.
- ValueError If given name list is empty.

Note: Drops suffix and adds nickname to middle names.

Module contents

```
Chapter 1 Challenge Projects.
src.ch01.challenge.ADD_KEYS_ERROR
    String with TypeError for add_keys_to_dict().
         Type str
src.ch01.challenge.SPLIT_NAME_LIST_ERROR
    String with TypeError for split_names().
         Type str
src.ch01.challenge.SPLIT_NAME_EMPTY_ERROR
    Sting with ValueError for split names ().
         Type str
src.ch01.challenge.ADD_NAME_TO_KEY_ERROR
    String with TypeError for add_name_to_key().
         Type str
src.ch01.challenge.GENERATE_NAME_ERROR
    String with KeyError for generate_name().
         Type str
src.ch01.challenge.BUILD_LIST_ERROR
    String with IndexError for build_name_list().
         Type str
```

src.ch01.practice package

Submodules

src.ch01.practice.p1 pig latin module

Takes a word as input and returns its Pig Latin equivalent.

```
src.ch01.practice.pl_pig_latin.encode (word: str) \rightarrow str Check if word starts with vowel, then translate to Pig Latin.
```

If a word begins with a consonant, move the consonant to the end of the word and add 'ay' to the end of the new word. If a word begins with a vowel in *VOWELS*, add 'way' to the end of the word.

Parameters word (str) – Word to encode to Pig Latin.

Returns Encoded Pig Latin word.

Raises TypeError – If word is not a string.

```
src.ch01.practice.p1_pig_latin.main()
    Demonstrate Pig Latin encoder.
```

src.ch01.practice.p2 poor bar chart module

Takes a sentence as input and returns a 'bar chart' of each letter.

```
src.ch01.practice.p2_poor_bar_chart.freq_analysis (sentence: str) \rightarrow dict Perform frequency analysis of letters in sentence.
```

Iterate through each letter in the sentence and add it to a dictionary of lists using collections. default.dict.

Parameters sentence (str) – String to count letters of.

Returns defaultdict with each letter as keys and a list with letters repeated based on their frequency as values.

Example

Raises TypeError – If **sentence** is not a string.

```
src.ch01.practice.p2_poor_bar_chart.main()
    Demonstrates the Poor Bar Chart.
src.ch01.practice.p2_poor_bar_chart.print_bar_chart (freq_dict: dict) → None
    Print dictionary to terminal.

Use pprint.pprint() to print dictionary with letter frequency analysis to terminal.
```

analysis

from

frequency

```
freq_analysis().
          Returns None. Prints freq_dict.
          Raises TypeError – If freq_dict is not a dictionary.
Module contents
Chapter 1 Practice Projects.
src.ch01.practice.VOWELS
     Tuple containing characters of the English vowels (except for 'y')
          Type tuple
src.ch01.practice.ENCODE_ERROR
     String with TypeError for Pig Latin encode ().
          Type str
src.ch01.practice.FREQ_ANALYSIS_ERROR
     String with TypeError for Poor Bar Chart freq_analysis().
          Type str
src.ch01.practice.PRINT_BAR_CHART_ERROR
     String with TypeError for Poor Bar Chart print bar chart ().
          Type str
Module contents
Chapter 1.
src.ch02 package
Submodules
src.ch02.c1 recursive palindrome module
Recursively determine if a word is a palindrome.
src.ch02.c1\_recursive\_palindrome.main(word: str = None) \rightarrow None
     Demonstrate the recursive palindrome tester.
     This is only supposed to be a demo, but coverage necessitates excessiveness.
          Parameters word (str) – Word to test if it is a palindrome.
          Returns None. Identifies word as a palindrome.
src.ch02.c1_recursive_palindrome.recursive_ispalindrome(word: str) \rightarrow bool
     Recursively check if a word is a palindrome.
          Parameters word (str) – String to check palindromeness.
          Returns True if the word is a palindrome, False otherwise.
          Raises TypeError – If word is not a string.
```

Parameters freq_dict

(dict) -

Dictionary

with

src.ch02.p1_cleanup_dictionary module

Cleanup word dictionary.

Various functions for cleaning up a word dictionary.

 $\verb|src.ch02.p1_cleanup_dictionary.APPROVED_WORDS|\\$

Words that should always appear in a word dictionary.

Type list

 $src.ch02.p1_cleanup_dictionary.cleanup_dict(filepath: str) \rightarrow list$ Wrap read_from_file and cleanup_list.

Passes given **filepath** through <code>read_from_file()</code> to get a list of words, then <code>cleanup_list()</code> to remove single letter words.

Parameters filepath (str) – String with path to word dictionary file.

Returns List with words as elements excluding single letter words.

 $\verb|src.ch02.p1_cleanup_dictionary.cleanup_list| (word_list: list) \rightarrow list| Cleanup| word| list.$

Remove single letter words from a list of words.

Parameters word_list (list) – List with words as elements.

Returns List with words as elements excluding single letter words.

Raises IndexError – If word_list is empty.

 $src.ch02.p1_cleanup_dictionary.cleanup_list_more (word_list: list) \rightarrow list$ Cleanup word list even more.

First, remove words with apostrophes, double letter words, duplicates, and words with letters not in string. ascii_lowercase from a list of words. Then, add <code>APPROVED_WORDS</code> back into list. Finally, sort list.

Parameters word_list (list) – List with words as elements.

Returns Sorted list with words as elements excluding cleaned words and APPROVED_WORDS added.

Raises IndexError – If word_list is empty.

src.ch02.p1_cleanup_dictionary.main()
 Demonstrate cleanup dictionary.

Module contents

```
Chapter 2.
```

```
src.ch02.DICTIONARY_FILE_PATH
```

String with path to Ubuntu 18.04.2's American English dictionary file.

Type str

```
src.ch02.CLEANUP LIST ERROR
```

String with IndexError for Cleanup Dictionary cleanup_list().

Type str

src.ch02.RECURSIVE ISPALINDROME ERROR

String with TypeError for Recursive Palindrome recursive_ispalindrome().

Type str

src.ch03 package

Submodules

src.ch03.c1 anagram generator module

Generate phrase anagrams from a word or phrase.

```
src.ch03.c1\_anagram\_generator.anagram\_generator(word: str) \rightarrow list Generate phrase anagrams.
```

Make phrase anagrams from a given word or phrase.

Parameters word (str) – Word to get phrase anagrams of.

Returns list of phrase anagrams of word.

Adds words from given word list to a given anagram dictionary.

Parameters

- word_list (list) List of words to add to anagram dictionary.
- **dictionary** (*dict*) Anagram dictionary to add words to.

Returns None. If words in **word_list** are in **dictionary** they are not added. Otherwise, they are added.

```
src.ch03.c1_anagram_generator.find_anagram_phrases (phrases: list, word: str, anagram_dict: dict, phrase: list) \rightarrow None
```

Find anagram phrases.

Recursively finds an agram phrases of **word** by removing unusable words from the **anagram_dict**, finding remaining anagrams given the **phrase**, then adding any found anagram phrases to **phrases**.

Parameters

- phrases (list) List of anagram phrases.
- word (str) Current word to find anagram phrases of.
- anagram_dict (dict) Current anagram dictionary to find anagrams with.
- **phrase** (list) Current anagram phrase candidate.

Returns None. **phrases** is updated with any found anagram phrases.

 $src.ch03.c1_anagram_generator.find_anagrams$ (word: str, anagram_dict: dict) \rightarrow list Find anagrams in word.

Find all anagrams in a given word (or phrase) using anagram dictionary.

Parameters

• word (str) – Word to find anagrams of.

• anagram_dict - Dictionary from get_anagram_dict().

Returns list of str with all anagrams in word.

 $src.ch03.c1_anagram_generator.get_anagram_dict(word_list: list) \rightarrow dict$ Get an anagram dictionary from word_list.

Get the ID of each word in word list and add it to a dictionary with the ID as the key.

Parameters word_list (list) – List of words to make into anagram dictionary.

Returns defaultdict of list with an ID (int) as the key and words whose product of letters equal that ID as values.

```
src.ch03.c1\_anagram\_generator.get\_id(word: str) \rightarrow int Get ID number of word.
```

Assign a unique prime number to each letter in ascii_lowercase. The product of each letter in word is its ID number.

Parameters word (str) – Word to get ID of.

Returns int representing ID of word.

```
src.ch03.c1_anagram_generator.get_primes (length: int = 26, min_prime: int = 2, max_prime: int = 101) \rightarrow list Get list of primes.
```

Given a length, minimum, and maximum prime number, return a list of prime numbers.

Parameters

- length (int) Number of prime numbers to return. Defaults to 26.
- min_prime (int) Smallest prime number to return. Defaults to 2.
- max_prime (int) Largest prime number to return. Defaults to 101.

Returns list of **length** prime numbers with **min_prime** as the smallest prime number and **max_prime** as the largest prime number in the list.

```
src.ch03.c1_anagram_generator.main()
Demonstrate the Anagram Generator.
```

 $src.ch03.c1_anagram_generator.multi_get_anagram_dict(word_list: list) \rightarrow dict$ Multithreaded get anagram dictionary.

Uses os.cpu_count() and threading. Thread to use all CPUs to make an anagram dictionary with the intent of being more efficient than $get_anagram_dict()$.

Parameters word_list (list) - List of words to make into anagram dictionary.

Returns defaultdict of list with an ID (int) as the key and words whose product of letters equal that ID as values.

Warning: Avoids race conditions by heavily relying on CPython's Global Interpreter Lock. More info about Thread Objects.

```
src.ch03.c1\_anagram\_generator.remove\_unusable\_words (anagram\_dict: dict, usable\_letters: list) <math>\rightarrow dict
```

Remove unusable words from anagram dictionary.

Creates new anagram dictionary by including only IDs that can be IN usable_letters.

Parameters

- anagram_dict (dict) Anagram dictionary to prune.
- usable letters (list) List of letters that must be used.

Returns defaultdict of list with an ID (int) as the key and words whose product of letters equal that ID as values.

```
src.ch03.c1_anagram_generator.split (a\_list: list, parts: int) \rightarrow list Split a list into parts.
```

Split given list into given number of parts.

Parameters

- a_list (list) List to split.
- parts (int) Number of parts to split list into.

Returns List of lists with a_list split into parts.

Example

```
>>> import src.ch03.c1_anagram_generator.split as split
>>> some_list = ['this', 'is', 'a', 'list']
>>> split_list = split(some_list, 2)
>>> print(split_list)
[['this', 'is'], ['a', 'list']]
```

src.ch03.p1 digram counter module

Counts the occurrence of all possible digrams of a word in a dictionary.

```
src.ch03.p1\_digram\_counter.count\_digrams (digrams: set, dict\_list: list) \rightarrow dict
Count digrams in word dictionary.
```

Count frequency of each digram in the set in a word dictionary list.

Parameters

- digrams (set) Set of digrams to count frequency of.
- dict_list (list) Word dictionary list.

Returns Counter with digrams as keys and their counts as values.

Raises TypeError – If digrams isn't a set or if dict_list isn't a list.

```
src.ch03.p1_digram_counter.digram_counter(word: str, dict_file: str = '/usr/share/dict/american-english') \rightarrow dict
```

 $Wrap\ get_digrams,\ count_digrams,\ and\ read_from_file.$

Send word through <code>get_digrams()</code> to get a set of digrams which is then passed through <code>count_digrams()</code> along with the list made by passing <code>dict_file</code> through <code>read_from_file()</code>.

Parameters

- word (str) Word to get digrams of.
- dict_file (str) Path of dictionary file to get a frequency analysis of each digram. Defaults to DICTIONARY_FILE_PATH.

Returns Counter with digrams as keys and their counts as values.

```
src.ch03.p1_digram_counter.get_digrams (word: str) → set
     Get a set of digrams given a word.
     Generate all possible digrams of a given word.
          Parameters word (str) – String to get digrams of.
          Returns set of all possible digrams of the given word.
          Raises TypeError – If word isn't a string.
src.ch03.p1_digram_counter.main()
     Demonstrate the digram counter.
Module contents
Chapter 3.
src.ch03.GET_DIGRAMS_ERROR
     String with TypeError for get_digrams().
          Type str
src.ch03.COUNT_DIGRAMS_ERROR
     String with TypeError for count_digrams().
          Type str
src.ch04 package
Subpackages
src.ch04.challenge package
Submodules
src.ch04.challenge.c1 encode route module
Encode a route cipher and replace code words.
src.ch04.challenge.cl_encode_route.encode_route(plaintext: str, keys: list, rows: int) →
                                                              list
     Encode plaintext message with route cipher.
     Clean plaintext with format_plaintext(), replace sensitive intel with replace_words(), fill with
     dummy words using fill_dummy () until keys and rows are factors, then encrypt with a route cipher using
     keys.
          Parameters
                • plaintext (str) – Plaintext message to encode with route cipher.
                • keys (list) – List of positive/negative integers representing cipher route.
                • rows (int) – Number of rows to use in the route cipher table.
          Returns List of strings of transposed words.
```

Note: Assumes vertical encoding routes.

```
src.ch04.challenge.cl\_encode\_route.fill\_dummy (plainlist: list, factors: list, dummy\_words: list = None) <math>\rightarrow list
```

Fill a plainlist with dummy words.

Adds pseudorandom dummy words to the end until the factors of the length of plainlist includes factors.

Parameters

- plainlist (list) List of words of plaintext message.
- factors (list) List of integers that must be factors of the length of plainlist.
- dummy_words (list) List of dummy words to use as filler. If not provided, defaults to DICTIONARY_FILE_PATH using cleanup_dict().

Returns Same list as **plainlist**, but with dummy words added.

```
src.ch04.challenge.cl\_encode\_route. format_plaintext (plaintext: str) \rightarrow list Format plaintext message for encoding.
```

Prepare **plaintext** for route cipher encoding. Convert to lowercase, remove punctuation.

Parameters plaintext (str) – Plaintext message to format.

Returns List of strings of each word in plaintext message.

```
{\tt src.ch04.challenge.c1\_encode\_route.\textbf{main}()}
```

Demonstrate the route cipher encoder.

```
src.ch04.challenge.cl\_encode\_route.replace\_words (plainlist: list, code\_words: dict = None) <math>\rightarrow list
```

Replace sensitive words with code words.

Replace words that shouldn't be transmitted with code words.

Parameters

- **plainlist** (*list*) List of strings of each word in plaintext message.
- **code_words** (dict) Dictionary of sensitive words and their code words. If not provided, defaults to the book's code words. Use lowercase strings in dictionary.

Returns Same list, but with sensitive words replaced with code words.

src.ch04.challenge.c2_encode_rail module

Encode message with a 3-rail fence cipher.

```
src.ch04.challenge.c2\_encode\_rail.encode\_rail(plaintext: str, split: int = 5) \rightarrow str
Encode rail fence cipher.
```

Encode **plaintext** with a 3-rail fence cipher. Scrub the plaintext with format_plaintext(), then encrypt it with split_rails().

Parameters

- **plaintext** (*str*) Message to encrypt with 3-rail fence cipher.
- **split** (*int*) How many letter segments to split message into. Defaults to 5.

Returns String with encrypted message split into **split** chunks for easier transmission.

```
src.ch04.challenge.c2_encode_rail.main()
    Demonstrate 3-rail fence cipher encoder.
src.ch04.challenge.c2_encode_rail.split_rails(plaintext: str) -> str
    Split plaintext into 3 rails for encryption.
```

Split the rails where the top rail is every 4th letter, the middle rail is every other letter starting at 1, and the bottom rail is every 4th letter starting at 2. After splitting, concatenate each rail and return the result.

Parameters plaintext (str) – Plain text message without spaces or punctuation.

Returns String with message encrypted using 3 rail fence cipher.

Module contents

Chapter 4 Challenge Projects.

src.ch04.practice package

Submodules

src.ch04.practice.p1_hack_lincoln module

Hack route cipher sent by Abraham Lincoln.

```
src.ch04.practice.pl_hack_lincoln.decode_route (keys: list, cipherlist: list) <math>\rightarrow list Decode route cipher.
```

Decode cipherlist encoded with a route cipher using keys.

Parameters

- **keys** (*list*) List of signed, integer keys.
- **cipherlist** (*list*) List of strings representing encoded message.

Returns List of strings representing plaintext message.

Note: Assumes vertical encoding route.

```
src.ch04.practice.pl_hack_lincoln.get_factors (integer: int) \rightarrow list Get factors of integer.
```

Calculate factors of a given integer.

Parameters integer (int) – Number to get factors of.

Returns List of integer factors of **integer**.

```
src.ch04.practice.pl_hack_lincoln.hack_route (ciphertext: str) \rightarrow None Hack route cipher.
```

Hack route cipher by using $get_factors()$ to find all possible key lengths. Then use keygen() to generate all possible keys and pass each one through $decode_route()$.

Parameters ciphertext (str) – Message encoded with route cipher.

Returns None. Prints all possible decoded messages.

```
src.ch04.practice.pl\_hack\_lincoln.keygen(length: int) \rightarrow list
Generate all possible route cipher keys.
```

Generates a list of all possible route cipher keys of length.

Parameters length (*int*) – Length of route cipher key.

Returns List of lists of integers representing all possible route cipher keys of **length**.

Example

```
>>> from src.ch04.practice.p1_hack_lincoln import keygen
>>> keygen(2)
[[-1, -2], [-1, 2], [1, -2], [1, 2]]
```

```
src.ch04.practice.pl_hack_lincoln.main()
```

Demonstrate hack of Lincoln's route cipher.

src.ch04.practice.p2 identify cipher module

Identify letter transposition or substitution cipher.

```
src.ch04.practice.p2\_identify\_cipher.identify\_cipher(ciphertext: str, threshold: float) \rightarrow bool
```

Identify letter transposition or substitution cipher.

Compare most frequent letters in **ciphertext** with the most frequent letters in the English alphabet. If above **threshold**, it is a letter transposition cipher. If not, it is a letter substitution cipher.

Parameters

- **ciphertext** (*str*) Encrypted message to identify.
- **threshold** (*float*) Percent match in decimal form.

Returns True if the **ciphertext** is a letter transposition cipher. False otherwise.

 $src.ch04.practice.p2_identify_cipher.is_substitution (ciphertext: str) \rightarrow bool$ Identify letter substitution cipher.

Wrapper for identify_cipher(). threshold defaults to 0.45.

Parameters ciphertext (str) – Encrypted message to identify.

Returns True if the **ciphertext** is a letter substitution cipher. False otherwise.

 $src.ch04.practice.p2_identify_cipher.is_transposition(ciphertext: str) \rightarrow bool$ Identify letter transposition cipher.

Wrapper for identify_cipher(). threshold defaults to 0.75.

Parameters ciphertext (str) – Encrypted message to identify.

Returns True if the **ciphertext** is a letter transposition cipher. False otherwise.

 $src.ch04.practice.p2_identify_cipher.main(ciphertext: str = None) \rightarrow None$ Demonstrate the cipher identifier.

This is only supposed to be a demo, but coverage necessitates excessiveness.

Parameters ciphertext (str) – Encrypted letter transposition or letter substitution cipher to demonstrate.

Returns None. Identifies ciphertext's cipher.

src.ch04.practice.p2_identify_cipher_deco module

Identify letter transposition or substitution cipher using decorator.

Note: Not part of the book, I was just curious about decorators and decided to tinker with them a bit.

```
src.ch04.practice.p2_identify_cipher_deco.identify(threshold: float = 0.5)
Make decorator for identify_cipher.
```

Decorator factory to replace a decorated function with <code>identify_cipher()</code>. A bit like going around the world to reach the teleporter across the street, but at import time instead of runtime, so it doesn't matter.

Luciano Ramalho's book *Fluent Python* appropriately calls decorators "syntactic sugar" when they aren't used in classes. It also references the wrapt module's blog on GitHub for a deeper explanation of decorators.

Not sure what a decorator factory would be called... syntactic caramel?

Parameters threshold (float) – Percent match in decimal form.

Returns Whatever the output of identify_cipher() would be given the decorated function's input.

 $src.ch04.practice.p2_identify_cipher_deco.is_substitution (ciphertext: str) \rightarrow bool$ Identify letter substitution cipher.

Empty function to wrap with identify_cipher() using identify(). threshold defaults to 0.45.

Parameters ciphertext (str) – Encrypted message to identify.

Returns True if the **ciphertext** is a letter substitution cipher. False otherwise.

```
src.ch04.practice.p2\_identify\_cipher\_deco.is\_transposition(ciphertext: str) \rightarrow bool
```

Identify letter transposition cipher.

Empty function to wrap with identify_cipher() using identify(). threshold defaults to 0.75.

Parameters ciphertext (str) – Encrypted message to identify.

Returns True if the **ciphertext** is a letter transposition cipher. False otherwise.

src.ch04.practice.p3_get_keys module

Get route cipher key from user and store as dictionary.

Note: Assumes vertical cipher routes.

```
src.ch04.practice.p3_get_keys.get_keys() \rightarrow list Get route cipher keys from user.
```

User only has to enter positive/negative integers. Each gets added to a list and returned when the user has no other keys to add.

Returns List of integers as column numbers and positive/negative values as route direction.

```
src.ch04.practice.p3\_get\_keys.key\_to\_dict(keys: list) \rightarrow dict
Convert route cipher key to dictionary.
```

Take a route cipher key in list format where integers are column numbers and positive/negative is the route direction and convert to a dictionary where the column numbers are keys and the route direction as up/down are the values.

Parameters keys (list) – List of integers with direction as positive/negative.

Returns Integers keys and up/down as values.

```
src.ch04.practice.p3_get_keys.main()
```

Demonstrate getting route cipher keys from the user.

src.ch04.practice.p4_generate_keys module

Generate route cipher keys for brute-forcing a route cipher.

Already implemented with *keygen()*, but this version will return a list of tuples.

```
src.ch04.practice.p4_generate_keys.generate_keys (length: int) \rightarrow list Generate all possible route cipher keys.
```

Generates a list of all possible route cipher keys of length.

Parameters length (*int*) – Length of route cipher key.

Returns List of tuples of integers representing all possible route cipher keys of **length**.

```
src.ch04.practice.p4_generate_keys.main()
    Demonstrate the key generator.
```

src.ch04.practice.p5_hack_route module

Another way to hack a route cipher.

Already implemented in $p1_hack_lincoln$, but this version will use the building blocks made in $p2_identify_cipher$, $p3_get_keys$, and $p4_generate_keys$.

```
src.ch04.practice.p5\_hack\_route.decode\_route (keys: dict, cipherlist: list) \rightarrow list Decode route cipher.
```

Decode **cipherlist** encoded with a route cipher using **keys**.

Parameters

- **keys** (*dict*) up/down dictionary with column numbers as keys.
- **cipherlist** (*list*) List of strings representing encoded message.

Returns List of strings representing plaintext message.

Note: Assumes vertical encoding route.

```
src.ch04.practice.p5\_hack\_route.hack\_route (ciphertext: str, columns: int) \rightarrow None Hack route cipher using brute-force attack.
```

Determine if **ciphertext** is a transposition cipher. If so, use **columns** to generate all possible keys. Convert each key to an up/down dictionary for each route to take, then print the result of each key.

Parameters

- **ciphertext** (*str*) Route cipher encoded string to hack.
- columns (int) Number route cipher columns.

Returns None. Prints all possible decoded messages.

```
src.ch04.practice.p5_hack_route.main()
    Demonstrate the route cipher hacker.
```

Chapter 4 Practice Projects.

Module contents

Chapter 4.

src.ch05 package

Submodules

src.ch05.p1 encode null module

Encode a message in a list using a null cipher.

```
src.ch05.p1\_encode\_null.encode\_null (message: str, word\_list: list) \rightarrow list
Encode plaintext message with null cipher.
```

Embed **message** in a list of words using **word_list**. Use second letter in first word of cipherlist, then third letter in second word of cipherlist, and repeat until **message** is embedded in cipherlist.

Parameters

- **message** (*str*) Message to encrypt with null cipher. Spaces and punctuation are okay, but will be removed. Uppercase converted to lowercase.
- word_list (list) List of words to build cipherlist. The more the merrier.

Returns List of words with **message** embedded as described. Context is *not* provided.

Raises ValueError – if the list of names doesn't have a name with the needed letter.

```
src.ch05.p1_encode_null.main()
```

Demonstrate null cipher encoder.

Encode a message in a list of last names. First last name in list isn't used and some unused last names are added near the beginning of the list.

Tip: The website bestwordlist.com helped with the missing names.

src.ch05.p2_decode_null module

Decode plaintext message from null cipher.

```
src.ch05.p2_decode_null.decode_null(interval: int, ciphertext: str) \rightarrow str Decode message from null cipher.
```

For every word specified by interval in ciphertext, generate a string using each interval letter.

Parameters

- **interval** (*int*) nth letter of every nth word to form a string.
- **ciphertext** (*str*) String with null cipher encoded message. Spaces and punctuation are okay, but will be removed. Uppercase converted to lowercase.

Returns String containing nth letter of every nth word in **ciphertext**.

Example

```
>>> from src.ch05.p2_decode_null import decode_null
>>> ciphertext = 'national aeronautics space administration'
>>> decode_null(1, ciphertext)
'nasa'
```

```
src.ch05.p2_decode_null.main()
```

Demonstrate null cipher decoder.

Tip: The website bestwordlist.com helped a metric ton.

Module contents

Chapter 5.

src.ch06 package

Submodules

src.ch06.c1 invisible ink mono module

Use stenography to hide messages in a word processor document.

Use docx.Document to hide encrypted messages in a word processor document by embedding the encrypted message in a fake message's whitespace, then changing the encrypted message's font color to white.

Note: Using LibreOffice version 6.0.7.3

Warning: There are many ways this method of stenography can fail. Please don't use for actual covert operations (covered in MIT License).

 $src.ch06.c1_invisible_ink_mono.check_fit (plaintext: list, ciphertext: list) <math>\rightarrow$ int Check if ciphertext can fit in plaintext's whitespace.

Sum number of blanks in **plaintext** and compare to number of characters in **ciphertext** to see if it can fit.

Parameters

- plaintext (list) Paragraphs of a fake message in a list of strings (likely from get text()).
- **ciphertext** (list) Paragraphs of an encrypted message in a list of strings (likely from get_text()).

Returns Integer representing the number of needed blanks to fit **ciphertext** in **plaintext**. 0 would mean that **ciphertext** can fit in **plaintext**.

Note: To separate words, the blanks in **ciphertext** count toward the needed length of **plaintext**. By contrast, blank lines in **plaintext** do not count.

```
src.ch06.c1_invisible_ink_mono.main (fakefile: str = None, cipherfile: str = None, savepath: str = None) <math>\rightarrow None
```

Demonstrate the invisible ink writer.

Demonstrate write_invisible(), but for testing, it is a basic wrapper function for write_invisible(). Embed cipherfile in fakefile's whitespace.

Parameters

- **fakefile** (str) Path to .docx file with fake message. Defaults to ./clfiles/fake. docx.
- **cipherfile** (*str*) Path to .docx file with real message. Defaults to ./clfiles/real.docx.
- **savepath** (*str*) Path to .docx file for output. Defaults to ./clfiles/ DearInternet.docx.

Returns None. The contents of **cipherfile**'s text is embedded in **fakefile**'s whitespace and saved to **savepath**.

```
src.ch06.c1_invisible_ink_mono.write_invisible (plaintext: list, ciphertext: list, template_path: str = None, filename: str = None, filename: str = None
```

Embed ciphertext in plaintext's letter whitespace.

Open a template file, **template_path**, with the needed fonts, styles, and margins. Write each line in **plaintext** to the template file and add each line in **ciphertext** to **plaintext**'s space between letters by using a monospace font. Save the new file as **filename**.

Parameters

- plaintext (list) Lines of a fake message in a list of strings (likely from get_text()).
- ciphertext (list) Lines of an encrypted message in a list of strings (likely from get_text()).
- **template_path** (*str*) Absolute path to .docx file with predefined fonts, styles, and margins. Defaults to None. If not provided, defaults will be created.
- **filename** (str) File name to use for output file. Defaults to output .docx.

Returns None. **plaintext** is written to the file at **template_path** with **ciphertext** embedded in the blank space.

Raises ValueError – If the number of spaces in **plaintext** aren't enough to embed **ciphertext** based on output of <code>check_fit()</code>.

Note: As of python-docx v0.8.10, creating custom styles isn't well supported. More info here.

As a result, if a template isn't provided, the default template is modified to use a font named Courier New on Windows and Liberation Mono on other operating systems in the Normal style.

src.ch06.p1 invisible ink module

Use stenography to hide messages in a word processor document.

Use docx.Document to hide encrypted messages in a word processor document by embedding the encrypted message in a fake message's whitespace, then changing the encrypted message's font color to white.

Note: Using LibreOffice version 6.0.7.3

Warning: There are many ways this method of stenography can fail. Please don't use for actual covert operations (covered in MIT License).

src.ch06.p1_invisible_ink.check_blanks (plaintext: list, ciphertext: list) \rightarrow int Check if the ciphertext can fit in plaintext.

Compare the number of blank lines in **plaintext** to the number of lines in **ciphertext**. If they aren't a match, returns the number of extra blank lines needed.

Parameters

- plaintext (list) Paragraphs of a fake message in a list of strings (likely from get_text()).
- **ciphertext** (list) Paragraphs of an encrypted message in a list of strings (likely from get_text()).

Returns Integer representing the number of needed blank lines to fit **ciphertext** in **plaintext**. 0 would mean that **ciphertext** can fit in **plaintext**.

 $src.ch06.p1_invisible_ink.get_text$ (file_path: $str, skip_blank: bool = True$) \rightarrow list Get text from a docx file.

Loads paragraphs from the given docx file into a list. Optionally skips blank lines.

Parameters

- **file_path** (*str*) Absolute path to a .docx file to load.
- **skip_blank** (bool) Whether or not to skip blank lines. Defaults to True.

Returns Each paragraph in the docx file in a list of strings.

Note: Does not copy formatting from docx file - only text.

```
src.ch06.pl_invisible_ink.main (fakefile: str = None, cipherfile: str = None, savepath: str = None) <math>\rightarrow None
```

Demonstrate the invisible ink writer.

Demonstrate write_invisible(), but for testing, it is a basic wrapper function for write_invisible(). Embed cipherfile in fakefile's whitespace.

Parameters

- **fakefile** (str) Path to .docx file with fake message. Defaults to ./plfiles/fake.docx.
- cipherfile (str) Path to .docx file with real message. Defaults to ./plfiles/real.docx.
- savepath (str) Path to .docx file for output. Defaults to ./plfiles/ LetterToUSDA.docx.

Returns None. The contents of **cipherfile**'s text is embedded in **fakefile**'s whitespace and saved to **savepath**.

```
src.ch06.p1\_invisible\_ink.write\_invisible (plaintext: list, ciphertext: list, template\_path: str = None, filename: str = 'output.docx') \rightarrow None
```

Embed ciphertext in plaintext's whitespace.

Open a template file, **template_path**, with the needed fonts, styles, and margins. Write each paragraph in **plaintext** to the template file and add each paragraph in **ciphertext** to **plaintext**'s blank space. Save the new file as **filename**.

Parameters

- plaintext (list) Paragraphs of a fake message in a list of strings (likely from get text()).
- **ciphertext** (list) Paragraphs of an encrypted message in a list of strings (likely from get_text()).
- **template_path** (*str*) Absolute path to .docx file with predefined fonts, styles, and margins. Defaults to None. If not provided, defaults will be created.
- **filename** (str) File name to use for output file. Defaults to output.docx.

Returns None. **plaintext** is written to the file at **template_path** with **ciphertext** embedded in the blank space.

Raises ValueError – If the number of blank lines in **plaintext** aren't enough to embed **ciphertext** based on output of <code>check_blanks()</code>.

Note: As of python-docx v0.8.10, creating custom styles isn't well supported. More info here.

As a result, if a template isn't provided, the default template is used.

Module contents

Chapter 6.

src.ch07 package

Submodules

src.ch07.c1_breed_rats module

Efficiently breed rats to an average weight of 50000 grams.

Use genetic algorithm on a mixed population of male and female rats.

Bases: object

Efficiently breed rats to an average weight of target_wt.

Use genetic algorithm on a mixed population of male and female rats.

Weights and number of each gender vary and can be set by modifying the following:

Parameters

- num_males (int) Number of male rats in population. Default is 4.
- num_females (int) Number of female rats in population. Default is 16.
- target_wt (int) Target weight in grams. Default is 50000.
- **gen_limit** (*int*) Generational cutoff to stop breeding program. Default is 500.

```
static combine\_values(dictionary: dict) \rightarrow list
```

Combine dictionary values.

Combine values in a dictionary of lists into one list.

```
Parameters dictionary (dict) – Dictionary of lists.
```

Returns List containing all values that were in **dictionary**.

```
crossover(population: dict) \rightarrow dict
```

Crossover genes among members (weights) of a population.

Breed **population** where each breeding pair produces a litter of instance value for **litter_sz** pups. Pup's gender is assigned randomly.

To accommodate mismatched pairs, breeding pairs are selected randomly, and once paired, females are removed from the breeding pool while males remain.

Parameters population (dict) – Dictionary of lists with males and females as keys and specimen weight in grams as values.

Returns Dictionary of lists with males and females as keys and pup weight in grams as values.

property female_mode_wt

Most common adult female rat weight in initial population.

Default is 250.

Type int

property gen_limit

Generational cutoff to stop breeding program.

Default is 500.

```
Type int
```

get_population ($num_males: int = None, num_females: int = None) <math>\rightarrow$ dict Generate random population of rats.

Wraps populate () using num_males and num_females.

Parameters

- num_males (int) Number of males in population. If None, defaults to instance value.
- num_females (int) Number of females in population. If None, defaults to instance value

Returns Dictionary of lists with males and females as keys and specimen weight in grams as values.

property litter_sz

Number of pups per pair of breeding rats.

Default is 8.

Type int

property litters_per_yr

Number of litters per year per pair of breeding rats.

Default is 10.

Type int

property male_mode_wt

Most common adult male rat weight in initial population.

Default is 300.

Type int

property max_wt

Maximum weight of adult rat in initial population.

Default is 600.

Type int

measure (population: dict) \rightarrow float

Measure average weight of population against target.

Calculate mean weight of **population** and divide by **target_wt** to determine if goal has been met.

Parameters population (dict) – Dictionary of lists with males and females as keys and specimen weight in grams as values.

Returns float representing decimal percentage of completion where a value of 1 is 100%, or complete.

property min_wt

Minimum weight of adult rat in initial population.

Default is 200.

Type int

property mut_max

Scalar on rat weight of most beneficial mutation.

Default is 1.2.

Type float

property mut_min

Scalar on rat weight of least beneficial mutation.

Default is 0.5.

Type float

property mut_odds

Probability of a mutation occurring in a pup.

Default is 0.01.

Type float

 $mutate(litter: dict) \rightarrow dict$

Randomly alter pup weights applying input odds as a scalar.

For each pup in **litter**, randomly decide if a floating point number between instance values for **mut_min** and **mut_max** from uniform will be used as a scalar to modified their weight.

Parameters litter (dict) – Dictionary of lists with males and females as keys and specimen weight in grams as values.

Returns Same dictionary of lists with weights potentially modified.

property num_females

Number of female rats in population.

Default is 16.

Type int

property num_males

Number of male rats in population.

Default is 4.

Type int

populate ($pop_total: int, mode_wt: int) \rightarrow list$

Generate population with a triangular distribution of weights.

Use triangular to generate a population with a triangular distribution of weights based on mode_wt.

Parameters

- pop_total (int) Total number of rats in population.
- mode wt (int) Most common adult rat weight in initial population.

Returns List of triangularly distributed weights of a given rat population.

```
select(population: dict) \rightarrow dict
```

Select largest members of population.

Sort members in descending order, and then keep largest members up to instance values for **num_males** and **num_females**.

Parameters population (dict) – Dictionary of lists with males and females as keys and specimen weight in grams as values.

Returns Dictionary of lists of specified length of largest members of **population**.

Examples

$simulate(population: dict) \rightarrow tuple$

Simulate genetic algorithm by breeding rats.

Using **population**, repeat cycle of measure, select, crossover, and mutate until either **target_wt** or **gen_limit** are met.

Parameters population (dict) – Dictionary of lists with males and females as keys and specimen weight in grams as values.

Returns Tuple containing list of average weights of generations and number of generations.

Examples

```
>>> from src.ch07.c1_breed_rats import BreedRats
>>> sample_one = BreedRats()
>>> s1_population = sample_one.get_population()
>>> ave_wt, generations = sample_one.simulate(s1_population)
>>> print(generations)
248
```

property target_wt

Target weight in grams.

Default is 50000.

Type int

```
src.ch07.cl_breed_rats.main()
```

Demonstrate BreedRats class.

Use default values to run a demonstration simulation and display time (in seconds) it took to run.

src.ch07.c2_safe_cracker module

Use hill-climbing algorithm to solve a lock combination.

Solve a lock combination by randomly changing a tumbler's values one by one and noting whether the safe had a response. If so, lock the tumbler at that value and continue randomly changing tumbler values.

Previously, a locked tumbler can still be changed, but the safe wouldn't respond, so the change would be discarded. This improves upon the algorithm by removing the locked tumbler from the pool of tumblers to randomly change.

```
src.ch07.c2\_safe\_cracker.compare(combo: list, attempt: list) \rightarrow int
```

Compare items in two lists and count number of matches.

Compare each tumbler in **combo** with **attempt** and return the number of matches.

Parameters

- combo (list) Integers of safe combination.
- attempt (list) Integers of guessed safe combination.

Returns Number of tumbler matches between combo and attempt.

```
src.ch07.c2\_safe\_cracker.crack\_safe (combo: str) \rightarrow tuple
```

Crack a safe combination with a hill-climbing algorithm.

Solve a lock combination by randomly changing a tumbler's values one by one and noting whether the safe had a response. If so, lock the tumbler at that value, remove it from the pool of tumblers, and continue randomly changing tumbler values.

Parameters combo (str) – String of numbers representing combination of safe.

Returns Tuple with string of solved combination and number of attempts.

```
src.ch07.c2_safe_cracker.main()
```

Demonstrate safe cracker.

Use default combination to demonstrate <code>crack_safe()</code> and display time (in seconds) it took to run.

Module contents

Chapter 7.

src.ch08 package

Submodules

src.ch08.p1_count_syllables module

Test count_syllables with a word dictionary file.

Randomly select words from a word dictionary file and pass them through <code>count_syllables()</code> to find their syllable counts. Output each word with their respective syllable count.

```
src.ch08.p1_count_syllables.CMUDICT
```

Dictionary of CMUdict's phonemes with the word as a key and its phonemes as a list of lists.

```
Type dict
```

```
src.ch08.p1_count_syllables.MISSING_WORDS
```

Dictionary with syllable counts of words missing from CMUdict's phoneme list where the word is the key and its syllable count as an integer value.

```
Type dict
```

```
src.ch08.p1_count_syllables.count_syllables (words: list) \rightarrow int Use CMUdict to count syllables in English word.
```

Calculate sum of syllable counts for each word in **words**. Checks syllable counts in the nltk.corpus CMU-dict phoneme list, if word is not found in CMUdict, also checks local dictionary with syllable counts.

Parameters words (list) – List of strings to sum number of syllables.

Returns Integer representing number of syllables in words.

Note: Defaults to first element in CMUdict phoneme list. So, multiple syllable counts are ignored.

```
src.ch08.p1\_count\_syllables.format\_words(words: str) \rightarrow list Format words for processing.
```

Remove hyphens, convert to lowercase, and strip both punctuation and possessives from word or phrase.

Parameters words (str) – Word or phrase to format for processing.

Returns List of strings containing processed words.

```
src.ch08.p1_count_syllables.main()
    Demonstrate count_syllables with a word dictionary file.
```
